Hahn C, Liu H;

WPI; 2003-721759/68. N-PSDB; ADC27014. New isolated polynucleotide encoding human deubquitinating proteases, useful for identifying e.g. antiinflammatory or immunosuppressive agents, also the encoded polypeptides.

Claim 2; SEQ ID NO 12; 201pp; English.

The present invention describes human deubiquitinating protease enzymes (I), designated hDUB. The enzymes designated hDUB are located on chromosome 4, and the enzymes designated hDUBs are located on chromosome 8. Also described is a method for reducing inflammation, modulating autoimmune diseases and modulating immune reactions during infections by administering a compound (A) that inhibits (I) or alters regulation of the transcription of nucleic acid sequences encoding (I). (I) has antiinflammatory and immunosuppressive activities, and can be used in the regulation of cytokine receptor signaling involved in lymphocyte proliferation. (I) can be used for identifying their respective inhibitors (A). (A) are useful for reducing inflammation and to modulate autoimmune diseases or immune reactions during infections. The present sequence represents hDUB4.3 from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 22,

Patent No. 6103886
GENERAL INFORMATION:
APPLICANT: Whitchead Institute for Biomedical Research
APPLICANT: Lahn, Bruce
APPLICANT: Lahn, Bruce
APPLICANT: Lahn, Bruce
APPLICANT: David
TITLE OF INVENTION: Genes in the No. 6103886-Recombining Region of
TITLE OF INVENTION: the Y Chromosome
FILE REFERENCE: WH197-08pA
CURRENT APPLICATION NUMBER: US/09/058,489
CURRENT FILING DATE: 1998-04-10
EARLIER APPLICATION NUMBER: 60/041,877
EARLIER FILING DATE: 1997-04-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 2547;
